

# Form Tag Attributes in PHP - Handwritten Style Notes

## Form Tag Attributes in PHP

The `<form>` tag is used to collect user input and send it to a PHP script.

### 1. action:

- Defines where the form data should go.
- Example: `action="submit.php"`

### 2. method:

- Specifies how the data is sent.
- 'GET' = data in URL, 'POST' = hidden data.
- Example: `method="POST"`

### 3. enctype:

- Needed for file uploads.
- Example: `enctype="multipart/form-data"`

### 4. target:

- Controls where the response is shown.
- Example: `target="_blank"`

### 5. autocomplete:

- Turns browser autofill on/off.
- Example: `autocomplete="off"`

## Form Tag Attributes in PHP - Handwritten Style Notes

These help control how a form submits data to PHP.
